

# 19/01/2017 MEASURING TEMPERATURE VIA SMARTPHONE

## Log your temperature data using Android Phones.

The ThermoScan NFC Datalogger is suitable for logging temperature during the transport of your valuable payload. During the mission, a green LED shows that the temperature is within the limits. A red flashing LED shows the status alarm. The device communicates via NFC. 5000 Measurements are written on the internal storage. After reading out the data, you can send the data or a graph as a pdf file. The datalogger can be reused for the next mission.
